I am setting the PDFKIT headers/footers via the options. Everything is outputting fine.

```
options = {
  'page-size'      : 'Letter',
  'margin-top'     : '0.75in',
  'margin-right'   : '0.75in',
  'margin-bottom'  : '0.5in',
  'margin-left'    : '0.75in',
  'header-left'    : 'something',
  'header-right'   : '[section]',
  'footer-right'   : '[page]',
}
```

But how do I format them via css code?

I was thinking this would work but it does not.

```
@page {
  @top-left {
    font-size: .8rem;
    color: red;
  }
}
```

Thanks.

css pdfkit

I just discovered that the size, font, etc... are just more options. Oops.

--header-center <text>	Centered header text
--header-font-name <name>	Set header font name (default Arial)
--header-font-size <size>	Set header font size (default 12)
--header-html <url>	Adds a html header
--header-left <text>	Left aligned header text
--header-line	Display line below the header
--no-header-line	Do not display line below the header
--header-right <text>	Right aligned header text
--header-spacing <real>	Spacing between header and content in mm
